Automation and Guidance

Low cost, simple to install automation

Common home garden robotic products (lawnmowers, weeding systems) are expensive to run and require awkward sub-surface boundary wires to mark the edge of the active area.

Sagentia developed a purely optical, camera based navigation system; minimising the labour intensive, expensive installation process and maximising route planning / guidance capabilities for increased efficiency and efficacy.

The system deskills challenging aspects of automation and allows consumers to get up and running in minutes with enough flexibility to take account of different layouts and terrains.
