

Trend survey on optimisation of well design and well placement for tight reservoir

Following our delivery of a SOTA review of petrophysical technologies and techniques for tight reservoirs, the client requested a second review focused on optimisation of well design and well placement for tight reservoir.

We carefully selected 17 interviewees with the right expertise to provide a comprehensive view on the industry status when combined with in-house expertise.

The in-depth study covered the elements required to optimise operations in unconventional basins from day one.

The output was integrated into a framework, providing state-of-the-art information for designing and placing wells in different tight reservoir environments.
